

Pre-Week 1 Deployment Package: What You Have & How to Use It

Complete → You have everything you need to paper trade from Aug 25 through Sept 8, then deploy live by Week 1.

What's in This Package

1. PRE_WEEK1_PLAYBOOK.md

What it is: The strategic master document (40 pages)

Read when: First — set up your mindset, understand the phases

Contains:

NFL props opening line tracking protocol (semi-manual workflow)

CFB spreads power ranking model strategy

Paper trading infrastructure (bankroll allocation, tier system)

Weekly checklist for all 3 weeks

Go/No-Go decision tree for Sept 8

Action: Read this top to bottom first. It's your north star.

2. IMMEDIATE_ACTION_ITEMS.md

What it is: Tactical to-do list (1 page, scannable)

Read when: Today/tomorrow to prioritize your time

Contains:

This week's must-do checklist (4 items, ~4 hours)

Daily/weekly workflows for Aug-Sept

Success metrics for each week

Key learnings from 2026 audit (don't forget)

Action: Pin this. Refer to it daily for the next 3 weeks.

3. QUICK_REFERENCE.md

What it is: Cheat sheet (1 page, dense)

Read when: During the month, when you need quick lookup

Contains:

File directory (which file does what)
Daily metrics template (copy & paste for your tracking sheet)
2026 audit reminders (what worked, what didn't)
NFL market allocation (30% rec_yds, 25% receptions, etc.)
CFB power ranking weights
Placement timing hypothesis (to test)
Go-Live checklist (Sept 8 decision)

Action: Print this or bookmark it. Reference it 5-10 times per week.

4. cfb_power_ranking_model.py

What it is: Python class for CFB team ratings (250 lines)

Run when: This week (to build + test); weekly during Aug (to score games)

Contains:

`CFBPowerRankingModel` class with methods:

`load_data()` — ingest team records, recruiting, transfer portal

`calculate_team_rating()` — outputs 0-1 rating for any team

`calculate_win_probability()` — $P(\text{Team A beats Team B})$

`find_edges()` — compares model to market spreads, flags opportunities

`backtest_on_historical_games()` — validates model accuracy

How to use:

```
python
```

```

from cfb_power_ranking_model import CFBPowerRankingModel

model = CFBPowerRankingModel()
model.load_data('team_historical.csv', 'recruiting_ranks.csv')

# Score a single game
p_bama, rating_bama, rating_texas = model.calculate_win_probability('Alabama', 'Texas')
print(f"Alabama beats Texas: {p_bama:1%}")

# Find edges in a week's worth of games
games = [
    {'home_team': 'Alabama', 'away_team': 'Texas', 'spread': -3.5, 'book': 'DK'},
    {'home_team': 'Georgia', 'away_team': 'Ohio State', 'spread': -2.0, 'book': 'FD'},
]

edges = model.find_edges(games, min_edge_pct=1.5)
print(edges[['game', 'side', 'model_prob', 'market_prob', 'edge_pct']])

```

Where to put it: `edge-index/models/cfb_spreads_2027.py`

Dependencies: pandas, numpy (standard data stack)

5. weekly_performance_tracker.py

What it is: Analysis engine for paper trading results (400 lines)

Run when: Every Friday to generate weekly reports

Contains:

`WeeklyPerformanceTracker` class with methods:

- `aggregate_by_week()` — ROI + win% for each week
- `analyze_by_market()` — performance breakdown (rec_yds, pass_att, etc.)
- `analyze_by_book()` — which book had best lines for you (DK vs FD vs BetMGM)
- `analyze_by_timing()` — ROI by placement window (0-12h, 48-96h, etc.)
- `analyze_by_tier()` — Tier 1 (+2% edge) vs Tier 2 (+1.5%) performance
- `generate_weekly_report()` — full printable report per week
- `generate_season_summary()` — aggregate across all weeks

How to use:

python

```

from weekly_performance_tracker import WeeklyPerformanceTracker

tracker = WeeklyPerformanceTracker('paper_trades_aug2027.csv')

# Generate full season summary
tracker.generate_season_summary()

# Detailed breakdowns
print(tracker.analyze_by_market())
print(tracker.analyze_by_book())
print(tracker.analyze_by_timing())

# Most recent week report
tracker.generate_weekly_report()

```

Where to put it: `edge-index/scripts/weekly_performance_tracker.py`

Run after: Every Friday, once you have completed bets logged

Output: Printed to console; paste into a report document

6. NFL_PROPS_TRACKING_TEMPLATE.csv

What it is: Schema for your daily tracking (2 rows of example data)

Use when: Starting daily line tracking (Aug 25)

Columns:

Date, Book, Game, Player, Market, Side, Line, Price_Taken, Model_Edge_Pct, Tier
 Hours_Before_Kickoff, Timestamp_Placed, Status, Result, Units_Returned
 Close_Price_Same_Side, Close_Price_Opp_Side, Actual_CLV_Pct, Notes

How to use:

Copy this into a Google Sheet or local CSV

Add one row per bet you place

Update Status (open → result: win/loss) after the game

Fill Actual_CLV_Pct once closing prices are available

Run `weekly_performance_tracker.py` on this data to aggregate

Where to put it: `edge-index/data/nfl/paper_trades_aug2027.csv`

7. NFL_PROP_AUDIT_ANSWERS.md

What it is: Reference document for 2026 learnings (quantified)

Read when: You want to understand *why* the strategies are what they are

Contains:

Q1: Is +2.7% CLV correct? (answer: no, expected ROI is -0.5% to +0.5%)

Q2: How many bets for 80% power? (answer: ~9,000-9,500 bets accounting for clustering)

Detailed math on closing line movement fading

Market calibration: which props worked (+rec_yds, +receptions) vs didn't (-pass_yds, -rush_att)

CLV-to-ROI conversion failure analysis

Use case: When you see something unexpected in your August results, check this audit to see if it matches 2026 patterns.

Step-by-Step: How to Deploy This

Week 1 (Aug 25-31): Setup Phase

By EOD Friday:

Read `PRE_WEEK1_PLAYBOOK.md` (full read, 1-2 hours)

Read `IMMEDIATE_ACTION_ITEMS.md` (skim, 15 mins)

Copy `NFL_PROPS_TRACKING_TEMPLATE.csv` to Google Sheet

Build CFB dataset:

Scrape ESPN schedules (2021-2026)

Pull 247Sports recruiting ranks

Save to CSVs

Copy `cfb_power_ranking_model.py` to `edge-index/models/`

Test power ranking function on 3 teams (Bama, Texas, Ohio State)

Deliverable: Tracking sheet ready, CFB model tested

Week 2 (Sept 1-7): Validation Phase

Daily (10 mins):

10 AM ET: Pull opening lines from DK, FanDuel, BetMGM

Log in tracking sheet

Run NFL model for that day's games

Flag Tier 1 & 2 edges ($\geq +1.5\%$ model edge)

Paper-bet top 3-5 edges

Weekly (Friday):

Copy `weekly_performance_tracker.py` to `edge-index/scripts/`

Run it against your tracking sheet

Review: ROI by market, by book, by timing

Summarize findings in a doc

Deliverable: 50-75 paper bets, weekly report

Week 3 (Sept 8-14): Decision Phase

By Sept 8 morning:

Close out all paper bets from Aug

Run final `weekly_performance_tracker.py` for full month summary

Check against Go/No-Go criteria:

ROI +0.5% to +3%? → Green Light

ROI -2% to +0.5%? → Yellow Light

ROI < -5%? → Red Light

Check calibration:

Is 48-96h window better than <12h? (hypothesis test)

Is CFB model within $\pm 2\%$? (accuracy check)

Are rec_yds & receptions outperforming? (market validation)

Decision: Which light are you?

Green → Proceed to live Week 1 with full bankroll

Yellow → Proceed with 50% live / 50% paper

Red → Extend paper through September

Deliverable: August summary report + deployment decision

Week 1+ (Sept 15 onward): Live Deployment

Same infrastructure, real money:

Use same tracking sheet format (add live \$ column)

Use same tier system (1u, 2u, 3u)

Use same daily check-in (10 AM lines, model scoring)

Use same weekly reporting (`weekly_performance_tracker.py`)

Keep paper trading in parallel for at least 2-3 weeks so you can compare live vs paper performance and catch any execution issues.

Key Metrics to Track

Daily (update in tracking sheet)

Cumulative ROI: ____%

Cumulative win%: ____%

Profit/loss: ___ units

Weekly (generate with `weekly_performance_tracker.py`)

ROI by sport (NFL props, CFB spreads)

ROI by market (rec_yds, pass_att, spreads, etc.)

ROI by book (DK, FanDuel, BetMGM)

ROI by timing (0-12h, 12-48h, 48-96h, 96h+)

ROI by tier (Tier 1 vs Tier 2 vs Tier 3)

Decision (Sept 8)

Total bets placed: ___ (target: 100-120)

August ROI: ___% (target: +0.5% to +3%)

Win rate: __% (target: ≥52%)

Go/No-Go:  Green /  Yellow /  Red

File Structure After Setup

Troubleshooting

Q: What if I can't get CFB recruiting data?

A: Try 247Sports (<https://247sports.com/Rankings/>) or Rivals. If both fail, use ESPN depth charts as proxy (returning starters = higher rating).

Q: What if my tracking sheet gets too big?

A: After week 1, archive completed bets to a separate sheet; keep current week active for daily tracking.

Q: What if a market performs worse than 2026?

A: It's normal — 2026 data is one year, may not replicate. If market shows consistent losses (-5% ROI) after 25+ bets, stop using it and reallocate to proven markets.

Q: Do I need to modify the power ranking weights?

A: Not before Sept 8. Use 50/30/15/5 (win rate/recruiting/continuity/coaching). After validating on 3+ games, you can adjust based on calibration error.

Q: When should I go live?

A: Sept 8 decision point. If you hit Green Light (ROI +0.5-3%, win% ≥52%), deploy real money Week 1. If

Yellow, start with half bankroll. If Red, extend paper through Sept, revisit Oct 1.

Support & Syncing

You have Claude as your technical collaborator. Use it to:

Debug Python code (email me the error)

Interpret `weekly_performance_tracker.py` output

Adjust CFB power ranking weights mid-month

Troubleshoot data pipeline issues

Audit unexpected August results

Weekly sync: Mid-August, end of August, and Sept 8 (decision day).

Go. You've Got This.

You have:

- ✅ Strategic playbook (PRE_WEEK1_PLAYBOOK.md)
- ✅ Tactical checklist (IMMEDIATE_ACTION_ITEMS.md)
- ✅ CFB model (cfb_power_ranking_model.py)
- ✅ Performance tracker (weekly_performance_tracker.py)
- ✅ Tracking template (NFL_PROPS_TRACKING_TEMPLATE.csv)
- ✅ Reference docs (QUICK_REFERENCE.md, NFL_PROP_AUDIT_ANSWERS.md)

You have 3 weeks to:

Paper trade 100-120 bets across both sports

Validate that your models work in real market conditions

Make a data-driven decision to go live Week 1

By Sept 15: You'll be live on Week 1 NFL props + CFB spreads, running the same infrastructure you built in August.

Let's go.
